

**AMENDMENTS TO THE SPECIFICATION:**

Please replace the paragraph beginning on page 2, line 33 with the following amended paragraph.

With reference to FIG. 2, the elongated envelope includes a translucent ~~and/or~~ or transparent portion 22 (hereafter referred to as a translucent portion for the sake of brevity) and two opaque legs 24 and 26 that are interconnected by the translucent portion. The envelope can have a substantially sideways U-shaped or V-shaped configuration in cross-section. Preferably, the envelope will be made of an extruded plastic material. Furthermore, the translucent portion 22 will typically be colored to match the color of light emitted from the LED and the opaque legs will match the color of the translucent portion. A connecting leg 28 extends outwardly from an end of the opaque leg 24 opposite the translucent portion 22. The connecting leg 28 and the opaque leg 24 define a receiving channel 32. Similarly, the opaque leg 26 includes a connecting leg 34 extending outwardly from the end opposite the translucent portion. The connecting leg 34 and the opaque leg 26 define a receiving channel 36. The channels 32 and 36 are adapted to receive a portion of the channel support 18; the connection will be described in greater detail below.
